Final reporting template: software layout check

This document contains fictional software values. It is not a pilot or final study, and it contributes no market replications or economic evidence. The negative primary contrast, undefined deployment groups and large event counts exercise formatting. Real final inputs, figures and values require their own complete-sample validation and rendered review.

0.1 Complete final economic evaluation

The final evaluation contains all 500 declared fresh markets, seeds 60001–60500. Each market has 500 stocks, 100 candidate signals, one training year and 14 out-of-sample years of 252 dates. Every market is complete and independently replayed. Pilot markets and repeated same-seed numerical implementations are not added to this sample.

Method	$h\bar{U}$ (MC SE)	Mean wealth	Inactive	Mean moves
All Signals	0.04025 (0.00001)	1.100	0.200	1.00
Greedy	0.04025 (0.00001)	1.100	0.200	1.00
HAC	0.04025 (0.00001)	1.100	0.200	1.00
Catoni	0.04025 (0.00001)	1.100	0.200	1.00
Tail	0.03025 (0.00001)	1.100	0.200	1.00
Oracle	0.04025 (0.00001)	1.100	0.200	1.00

Table 1: Complete final-study fund outcomes. Utility includes all waiting dates and actual modeled trading costs and is scaled by $h = 252$, not an annual return or certainty equivalent. MC SE uses 500 independent markets. Mean moves include terminal choices, which create no subsequent fund return.

Role	Tail minus	Mean difference	MC SE	95% MC interval
Primary	All Signals	-0.01000	0.00000	[-0.01000, -0.01000]
Secondary	Greedy	-0.01000	0.00000	[-0.01000, -0.01000]
Secondary	HAC	-0.01000	0.00000	[-0.01000, -0.01000]
Secondary	Catoni	-0.01000	0.00000	[-0.01000, -0.01000]
Secondary	Oracle	-0.01000	0.00000	[-0.01000, -0.01000]

Table 2: The frozen paired analysis on all 500 final markets. Tail minus All Signals is primary; all other contrasts are secondary and unadjusted. Intervals are two-sided approximate Student Monte Carlo intervals with 499 degrees of freedom under the fixed DGP and signal library. Comparator priority was fixed after pilot inspection, before final output.

Every declared contrast is retained regardless of its sign. Zero observed Monte Carlo standard error does not establish zero population uncertainty. These portfolio differences do not causally isolate waiting costs: allocation paths, support choices and trading states also differ.

Method	ENTRY	PARK	REVIVE	SWAP	Choices	Executed
Greedy	0	0	0	0	0	0
HAC	0	0	0	0	0	0
Catoni	0	0	0	0	0	0
Tail	1	0	0	0	1	0

Table 3: Final-study lifecycle choices and executed deployments. Terminal choices are retained in choices and excluded from executed deployments. No absence of moves is interpreted as zero population probability.

Method	Executed	Positive gain	Mean gain (bp)	Entry cost (bp)
Greedy	0	–	–	–
HAC	0	–	–	–
Catoni	0	–	–	–
Tail	0	–	–	–

Table 4: Descriptive evaluator-only next-period gains from the actual previous fund allocation, including transition costs and excluding terminal choices. Positive means exceeding the unchanged 10^{-8} daily-utility tolerance. The historical test does not certify these gains, and a one-day gain is not lifetime trade value. Empty groups have undefined summaries.

Method	Follow-up (years)	Eligible events	Criterion within	Selected within
Greedy	1	9999999	8888888	7777777
Greedy	3	9999999	8888888	7777777
Greedy	5	9999999	8888888	7777777
HAC	1	9999999	8888888	7777777
HAC	3	9999999	8888888	7777777
HAC	5	9999999	8888888	7777777
Catoni	1	9999999	8888888	7777777
Catoni	3	9999999	8888888	7777777
Catoni	5	9999999	8888888	7777777
Tail	1	9999999	8888888	7777777
Tail	3	9999999	8888888	7777777
Tail	5	9999999	8888888	7777777

Table 5: Complete final-study stable-event counts with the stated calendar follow-up, retaining early responses through evaluator-only continuations. Each method has its own endogenous reference policies and event population. Dependent events are not independent replications; raw rates do not identify causal cross-method detection performance.

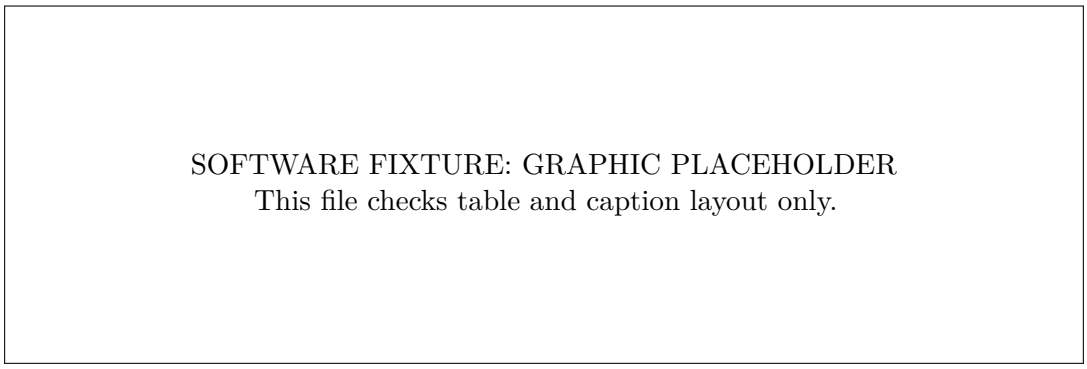

Figure 1: Final actual net wealth and selected support size. Wealth bands are descriptive 10th and 90th market percentiles, not confidence intervals.

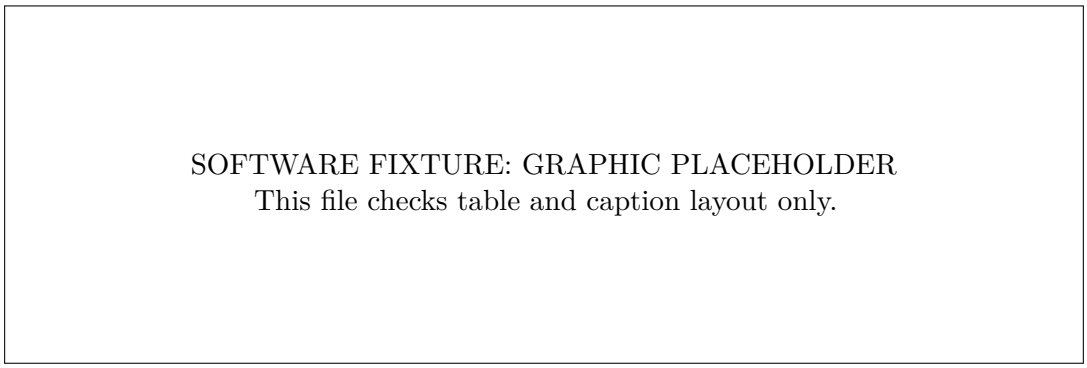

Figure 2: Final mean across markets of the largest currently open annual log capital. Closed comparisons are not carried forward. The individual threshold does not protect the entire search.
